

CINEMA TICKET BOOKING SYSTEM PROGAM

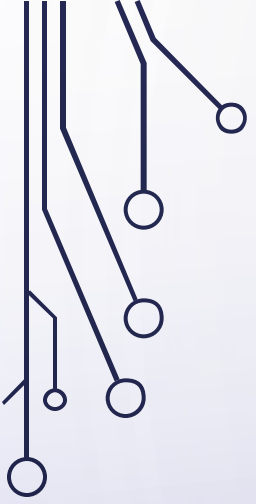

PRESENTED BY GROUP F

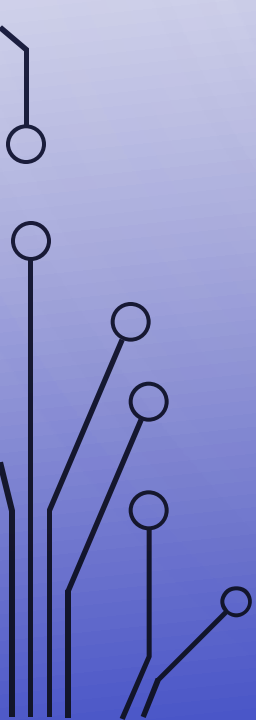

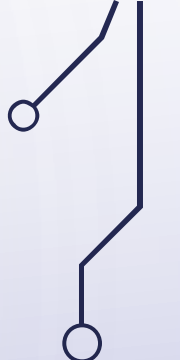

GROUP MEMBERS

NAME	REGISTRATION NUMBER
NAIWUMBWE ASSUMPTA	24/U/BIE/08557/PE
MUKINE JOEL	22/U/BIO/1688/PD
AUGUSTINE CEASAR OLOYA	24/U/BIE/03994/PE
RUGABA BENEDICT	25/U/BIE/01417/PE

INTRODUCTION

- The cinema ticket booking system can be used booking, cancelling the bookings, checking for available seats and other customers services in a movie theater.
 - As a group we were tasked to make a program, write a technical report and this presentation will portray how we arrange and came up with the program.
 - We used the IDE VS code, programming language, C and a report generator LaTeX and its editor Overleaf.
 - Then also incur the use GitHub and also the use of LLMs
- 
- 
- 

THE PROGRAM.

- The program was made using the language C and we used quite a number functions like printf, scanf in C which helped us to achieve the Cinema ticket Booking system to display and accept user input respectively.
- We used different kinds of directives like `#include<stdio.h>`, `#include<stdlib>` and `#include<string.h>` of which the use will be explained.
- Other techniques like Structures, voids, preprocessors and loops like while and if statements which will be explained later on.

EXPLANATION DIFFERENT TECHNIQUES.

STRUCTURES

- We used the structures to cater for the two scenarios when the customer comes.
- The scenario of booking and the scenario for choosing a movie.
- This saves us since the program will be able to cater for more than one customer

PREPROCESSORS

- They include;
 - `define MAX_SEATS 20`
 - `#define MAX_MOVIES 3`
 - `#define MAX_BOOKINGS 100`
- These help to define a constant value in the program.
- There are used to replace an assigned figure to where the variable has been placed.

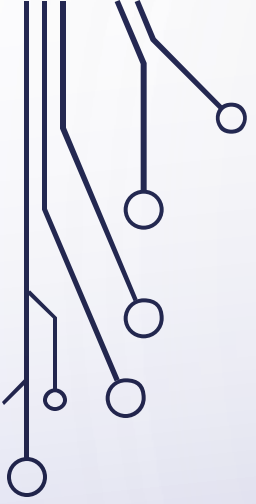

CONTINUED EXPLANATION.

DIRECTIVES

- `#include<stdio.h>`, `#include<stdlib>` and `#include<string.h>`
- These provided the necessary library from which the function like `printf` were obtain from.
- `#include<stdlib>` look new but it's where we get the function of `void`.

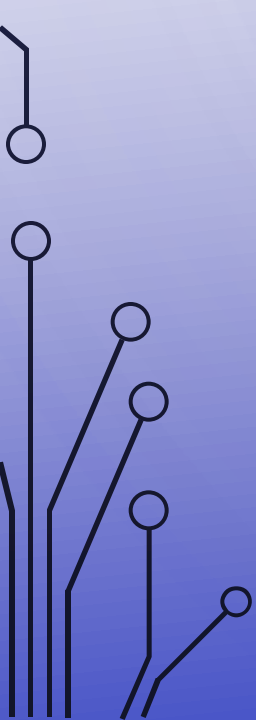

LOOPS

- In our program we used mainly two loop function, `while`, `if` and `switch`.
- The `while(1)` helped us to continuously accept user input; this was possible because of the `1` in the bracket which was tell the program the everything is true.
- The `if` was mainly used to distinguish child, student and adult.

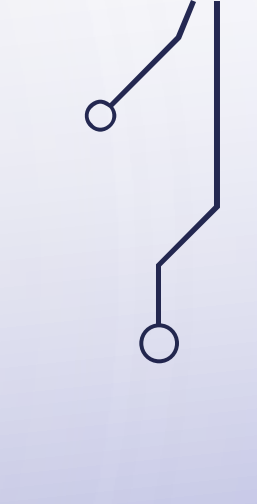

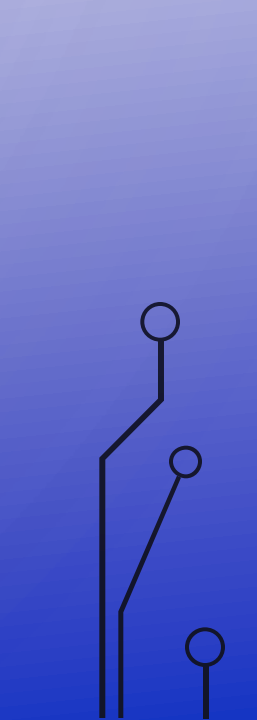

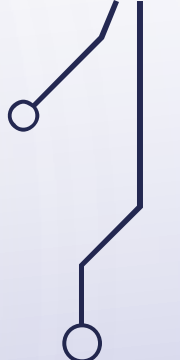

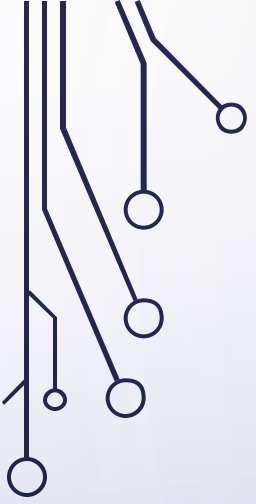

CONTINUATION

VOIDS

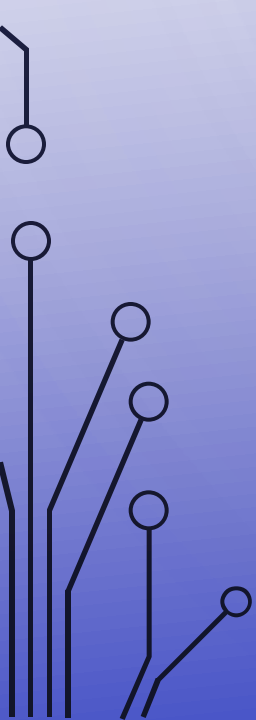

- These were used to cater for the different options in the menu.
 - The void function is used to perform operation just like the options in the menu but does not return a value.
- 

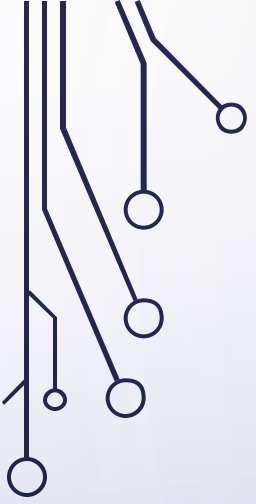

ARRAYS AND LOGICAL OPERATORS

- As we know arrays are used to store many elements of the same data type of which there features of indexing came in handy.
 - The Logical operators like ||, != were used to relate different elements.
- 
- 

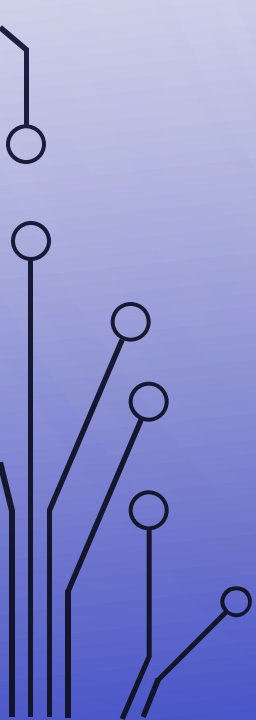

THE TECHNICAL REPORT.

- We were instructed to use report generator called LaTeX, to make a short technical report on our program.
 - We used software online editor called Overleaf, to organize the “code” that the editor recompiled and generated the report which is available in our GitHub repository link
 - The report includes the different structure of the program and its basic use in the World of Cinemas.
- 
- 

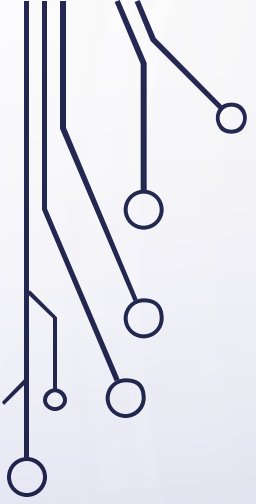

GITHUB AND LLMS

GITHUB

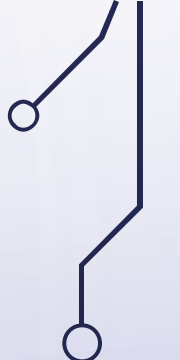

- The group used GitHub to make different edit to the program, the README file and the “code” to the LaTeX generated report.
 - This was done by the collaboration tools from Git Hub
- 

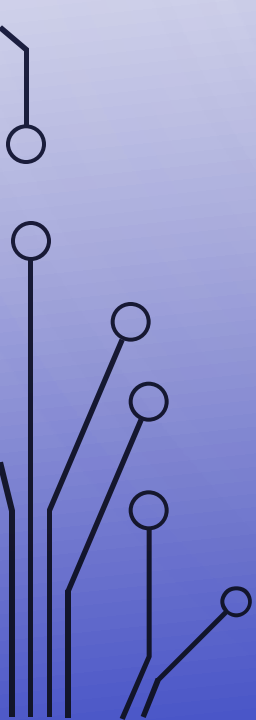

LLMS

- We used several Large Language Models (LLMs) to get ideas on the different tools the seemed new to us for example the LaTeX report generator.
 - We used LLMs like Gemini, GitHub Copilot and others
- 

CONCLUSION

- Programming is a key strategy in the business world as we have seen that the Booking system can be programmed and made available online rather than the physical appearance of customers hence saving time and resources while maximizing profits.
 - In the world of program, work can be made simpler and much more efficient with the help of different computing tools like GitHub and LLMs therefore saving time.
- 
- 

The background is a blue gradient. In the corners, there are decorative line art elements resembling circuit boards or neural networks, with lines and small circles.

THANK YOU FOR LISTENING
